Project Risk Management

Jorgelina Bross-Puglisi

Trainer & Consultant
IIL

About the Course

Have you been surprised by unplanned events during your projects? Are you and your project team frequently fighting fires? Well, you are not alone. Uncertainty exists in any project environment. While it's impossible to predict project outcomes with 100% certainty, you can influence the outcome, avoid potential risks, and be ready to respond to challenges that arise.

In this course, you'll gain the proper knowledge needed to identify, assess, plan responses for, and monitor risk in your projects. You'll learn how to successfully implement risk management processes, helping you to minimize uncertainty and achieve more consistent, predictable outcomes as a result. At the end of this course, you will be provided access to an on-demand module on using artificial intelligence to assist you with the risk management processes covered in class.

Hybrid Project Management Essentials

Jorgelina Bross-Puglisi

Trainer & Consultant
IIL

About the Course

In today's fast-moving, innovative and complex environment, one method of project management does not fit all. Successful project practitioners combine aspects of waterfall, Agile, and other methodologies to create a tailored approach to their projects. The vast majority of project practitioners blend practices to provide themselves with the flexibility they need to deliver value.

Hybrid Project Management Essentials provides a structured approach for blending roles, life cycles, and development approaches. You will learn how to combine fixed scope and evolving scope, and create schedules that allow for low-level evolution while maintaining high-level milestones. Hybrid project management requires negotiation and flexibility to balance iterative development while maintaining predictable delivery dates. You will learn to prioritize constraints, define completion criteria, and shift your approach if needed.
